COULIS

Taste infrastructure for AI. *The layer every AI calls before it speaks for you.*

Any AI
Claude, Cursor, an agent, an app

coulis
your facts, your voice, your taste

You
Send, Revise or Hold. Your yes.

We bring you back.

AI learned everyone. **coulis** adds your facts, your voice and your taste as a layer every AI runs through. It does not write for you. It revises and rewrites with your approval, your permission and an explanation.

A research lab.

We study one question: can taste be measured and learned? We learn it from the edits people make, model each person's voice from their own writing, and check the AI judge against human readers.

A B2B2C product.

Sold to the apps, agents and assistants people already use, and used directly inside Claude and Cursor today. Either way, the person behind the account is who the reader hears.

Bhavya Goel · San Francisco · October 2026

PROBLEM

Good writing can still sound wrong. *AI sounds like everyone.*

1	AI sounds like everyone else.
2	AI cannot express you: your creativity, your individuality, your taste. You explain yourself every time. It still comes out average.
3	Judgment is the one thing the labs are not optimising for. YC, Winter 2027: as models got better at code, their writing got worse.

YC RFS Winter 2027, LLMs That Write Well · LinkedIn cuts the reach of posts that read as AI by about 40%, CNN 18 Oct 2026 · Pangram, Oct 2026: 41% of long-form LinkedIn posts fully AI

INSIGHT

Your edits reveal your taste. *What you keep, change and reject.*

What we measure

Every edit you make is a labelled example: the draft, the version you sent, the context it was for. Not what you say you like. What you actually changed.

What we do with it

The edit becomes a proposed rule in plain words. You approve it or not. Approved rules join a taste file you own and are applied by audience and format: an investor update is not a launch post.

The hypothesis

Editorial decisions captured this way improve how much a draft on a topic you have never written about sounds like you, beyond a strong model given the same samples. Measured so far: 41 of 44 held-out posts. The unseen-topic test is next.

Status: edits and approvals captured today; unseen-topic transfer and a trained taste model are research, not product. docs/RESEARCH-AGENDA.md

HOW IT WORKS

Three steps. *Cheapest first, most personal last.*

Draft · LinkedIn · 14:02 — checked in 4 ms

HOLD — Four lines to settle: em dash, "game-changer", "300+ founders", "10x". Each quoted, with a fix in your words.

Check

Fixed rules, no AI model, about 4 ms, the same answer every time. Facts you never approved, the AI tells, a hook you already used. The answer comes in plain words, Send, Revise or Hold, with each problem quoted and an alternative in your own words.

Score

One number, 0 to 100: how much this draft sounds like you. Eight parts measured in the backend and averaged. You see the score, the weakest part, and one rewritten line.

Learn

Change a draft and it proposes the rule it saw. You approve. The rule joins a taste file you own. Continual learning from the one signal that is never wrong: what you actually sent.

Continual learning · Privacy · Security · Benchmarking · Validation · Approval first

Onboarding: one command builds your taste file from your LinkedIn data export (Settings, Data privacy, Get a copy of your data, Posts; about 10 minutes). No export: paste three posts and answer five questions. Privacy and security: your taste file stays on your machine; the basic check never calls a model; the API hashes keys and encrypts profiles and never logs drafts. Benchmarking and validation: known drafts with known answers before every release, and posts the system has never seen.

THE SCORE

coulis score 82. *Sounds like you.*

Clarity	8
Proof	9
Why you	**6**
Hook	8
Voice	9
Rhythm	9

Under 40

Sounds like AI. The tells are showing and the facts are not yours.

40 to 70

Getting there. The weakest part is named under the number, with one rewritten line.

70 and up

Sounds like you. 90 and up: ready to send. Read against your own recent posts, not against anyone else's.

One score for people and for agents: the same number an assistant reads before it sends. The eight parts stay in the backend for anyone who wants them.

OUR RESEARCH

What we used. *What it showed.*

2 in 3
of 673 posts pass untouched

46/47
team drafts fixed by one fact

41/44
held-out posts, 11 writers

15%
less reach when the check would hold

The data: 2,437 real posts across 38 voices, 2022 to 2026, from two companies the founder ran. 673 of her own published LinkedIn posts; 380 posts ghostwritten for founder clients (Notion); 1,384 posts from 29 client content sheets covering 28 brand and founder voices (889 from the social media agency, 495 from the personal branding consultancy); a 211-post LinkedIn engagement export; and 47 drafts one startup team wrote as its founder. One method every time: run the real writing through **coulis**, compare with what the writer actually did.

	The data	What it showed
1. Her archive	673 published posts	2 in 3 pass untouched; the rest carry the tells that read as AI.
2. One voice, many hands	47 team drafts written as the founder	One approved fact fixed 46 of 47; the one unsupported number was still caught.
3. Voice match	24 held-out posts, 6 founder voices; then 44 posts, 11 voices	Own profile scored higher in 16 of 24 (6 ties, 2 lower), then 41 of 44.
4. Reach	211 posts with real engagement	Posts the check would have held earned about 15% less.

Papers we stand on: Zheng 2023, LLM as judge · Padmakumar and He 2024, co-writing reduces diversity · Doshi and Hauser 2024, Science Advances · Chakrabarty 2025, 8,000 edits of AI text · Salemi 2024, LaMP personalization · Kobak 2024, excess vocabulary · Min 2023, FActScore. Every number reruns from the repo.

WHY NOW

Taste is being funded. *Writing is the open seat.*

	The data	What it means
THE DEMAND	LinkedIn cuts reach of posts that read as AI by about 40% (CNN, Oct 2026). 41% of long-form LinkedIn posts are fully AI; LinkedIn carries 62% of flagged AI content (Pangram, Oct 2026).	Posting under your own name now has a measurable AI penalty.
THE EVIDENCE	Writing got less varied as AI spread: 880,000 texts (Nature Human Behaviour, 2026). About half of new web articles are AI-written, yet 86% of top Google results are human (Graphite, 2026). 51 of 163 marketers name hallucinations a top concern; 97 proofread every AI output (Brafton).	Sameness is measured, and human writing still wins the ranking.
THE MONEY	Taste Labs raised an $18.5M seed to end AI slop at the model layer (June 2026). Design-taste add-ons for Claude passed 969K installs in 2026 (Taste Skill 626K, Impeccable 343K). AI writing assistant software: $1.3B to $6B in 2026 depending on the analyst; a bottom-up estimate of about $844M a year across creators, founders and teams.	Investors fund taste; writing has no funded leader inside the tools.
THE PLATFORM	YC, Winter 2027: LLMs That Write Well. YC, Summer 2026: the next trillion users will be AI agents. Glama lists 111,759 MCP servers; the official registry 51,152; no writing-specific MCP publishes install numbers.	The channel exists and the slot is empty.

Market sizing and MCP counts from the 27 Oct strategy map; ranges, not forecasts.

COMPETITION

Everyone else writes for you. *We judge what was written.*

	What it does	Public numbers	What users say	What coulis does instead
coulis	Checks facts and voice, scores, learns from edits	2 in 3 of 673 pass; 46 of 47; 16 of 24; 15%	In daily use on 673 real posts	Judges the draft against your facts and voice, then learns from your edit
Grammarly	Grammar, tone rewrites, Authorship, AI detector	54M visits a month; 40M people	"suggests a friendlier tone, then the formal one back" (G2)	
Jasper	Marketing copy, brand voice	About 420K visits a month	"the output always sounds so generic now" (review)	Never generates; scores and holds what was generated
Taplio · Supergrow	LinkedIn post generators in your voice	About 400K and 114K visits; Taplio 93% first-month trial churn	"I got better results working with ChatGPT directly" (Product Hunt)	Runs inside the tool you already write in; no new app to churn from
Writer · Typeface · Copy.ai	Enterprise brand voice, style rules	Writer 280K visits; Copy.ai absorbed into Fullcast	"conservative outputs, not for creative content" (review)	Approved facts plus voice, per person, not one company style guide
Humanizer · Voxfold · slop-linter	Remove or lint AI tells; the closest mechanics	Humanizer about 50,000 installs	Rewrites the text; no facts, no profile, no held-out test	Checks facts too, keeps a profile, publishes held-out results
Taste Labs · Impeccable · Taste Skill	Taste for models and for design	$18.5M seed; 343K and 626K installs	"That landing page example is devastatingly bad" (HN)	Taste for writing, learned per person, with a score an agent can gate on
Supermemory and memory tools	Store facts about you for the model		Memory, not judgment	Uses memory as input; the output is a verdict

Traffic: Similarweb and Semrush, 2026. Churn and absorption: 27 Oct strategy map. Full notes: research/SOCIAL-LISTENING-2026-10-26.md.

WHO IT IS FOR

People, machines, enterprises.
From day one.

People

Founders and teams: launch posts, LinkedIn and X posts, cold emails, bios, investor updates. Agencies and ghostwriters running many voices. Designers, brand teams and storytellers as the layer expands past text.

Machines

Every AI app, agent and assistant, through the API, the SDKs and MCP. The person behind the account is who the reader hears.

Enterprise

The paid door. We build a company's brand strategy and taste file from its own data, memory and approved facts, into a custom model that runs **coulis**, and integrate it into the systems it already uses (ERP, CRM, content tools). Custom work on their data is what is chargeable.

How people find it

The plug-in is free and open source: that is the distribution. Enterprise is where the revenue is.

FOUNDER AND ASK

Six years of leadership. *Built in a week.*

Bhavya Goel, 23, San Francisco

Freelancing from 17. Founded a social media agency in her first year of university and led an eight-person all-women team marketing 50+ consumer brands (2021 to 2025). Then a personal branding and B2B sales consultancy, ten retainer clients across the US, UK, UAE and India, run with a team, AI workflows and her own agents (2025 to 2026). LinkedIn Top Voice 2024.

Results

Own account: 1.5 million impressions and 290,073 members reached in the year to June 2026; 62K followers; a weekly newsletter on women building AI, 4,000+ subscribers. Clients, anonymised: one post reached 135,153 people; one account grew 506% to 368,605 impressions in 90 days.

Built in a week

github.com/bhavya-in-sf/coulis, open source under the MIT licence. Check, Score and Learn inside Claude Code, Claude Desktop and Cursor; MCP server; REST API preview with keys and encryption; Python and TypeScript SDKs; 21 automated tests that run before every release; one-command setup from the LinkedIn data export of your own posts. v0.6, since 21 Oct 2026.

Next 90 days

Nov: host the API, Slack and Cursor live, 25 founders on the plug-in. Dec: agency profiles and the team score gate, blind taste test published, 100 teams. Jan: one paid enterprise pilot, brand strategy and a custom taste model from their data, wired into their systems. **ASK: AMOUNT AND MILESTONE TO BE FILLED IN** after the work-authorization check.
